

Have you responded consistently to feedback and revised your work accordingly?

One of the very first check in, you have told me (not word to word but this is what I understood) that I was kind of shy in the class and it shown in my discussions in class and my code. I followed up by saying that for some reason I have a big imposter syndrome and that I don't know how to deal with it. You have then told me that it's normal and that instead of focusing on what I think I am lacking at I should use what I am strong at to my advantage and try to solve those problems. After that feedback I have been actively speaking my mind in class even when I think that others would think that my point is "stupid" and also I have been playing with code until I get it to work or at least until I know it is right no matter how many times I fail before that.

By the way I also wanted to say thank you for that feedback and the advice because it really help me develop some more confidence in myself as someone who codes.
